Derivative

Definition

$$f'(x) = rac{df(x)}{dx} = \lim_{\Delta x o 0} \left(rac{f(x+\Delta x) - f(x)}{\Delta x}
ight)$$

Derivatives of some named functions

$$egin{aligned} rac{d}{dx}\left(rac{1}{x}
ight) &= -rac{1}{x^2} \ rac{d}{dx}(sin(x)) &= cos(x) \ rac{d}{dx}(cos(x)) &= -sin(x) \ rac{d}{dx}(e^x) &= e^x \end{aligned}$$

Derivative rules

These rules help computing the derivation faster.

• Sum rule

$$\frac{d}{dx}(f(x) + g(x)) = f'(x) + g'(x)$$

Power rule

$$\frac{d}{dx}(ax^b) = abx^{b-1}$$

Product rule

$$rac{d}{dx}(f(x)g(x)) = f'(x)g(x) + f(x)g'(x)$$

Chain rule

$$\frac{d}{dx}g(h(x)) = g'(h(x))h'(x)$$

in other words

Given
$$g = g(u)$$
 and $u = h(x)$
then $\frac{dg}{dx} = \frac{dg}{du}\frac{du}{dx}$

• Total derivative: for the function f(x, y, z, ...), where each variable is a function of parameter t, the total derivative is

$$\frac{df}{dt} = \frac{\partial f}{\partial x}\frac{dx}{dt} + \frac{\partial f}{\partial y}\frac{dy}{dt} + \frac{\partial f}{\partial z}\frac{dz}{dt} + \dots$$

where

$$\frac{\partial f}{\partial x}$$

is the partial derivative of f with respect to x

Derivative structures

Given f = f(x, y, z),

Jacobian

$$J_f = \left[rac{\partial f}{\partial x}, rac{\partial f}{\partial y}, rac{\partial f}{\partial z}
ight]$$

where J is a *row vector* of the partial derivatives of f. This vector points in the *direction of the* greatest slope from the point (x, y, z), and the *bigger the norm* of this vector, the steeper the slope is.

Hessian

or, in a more compact notation

$$H = egin{bmatrix} \partial_{xx}f & \partial_{xy}f & \partial_{xz}f \ \partial_{yx}f & \partial_{yy}f & \partial_{yz}f \ \partial_{zx}f & \partial_{zy}f & \partial_{zz}f \end{bmatrix}$$

When the *determinant of the the Hessian matrix* is positive, we know we are either at a minimum or a maximum (the gradient is zero). If the element e_{11} of the Hessian is positive, we have a minimum; if it is negative, we have a maximum. If the determinant is negative, we have a **saddle point**.

Notes:

- o to calculate an Hessian matrix, it is easier to calculate first the Jacobian
- the Hessian matrix is symmetrical

Multi-variable chain rule

Example with $f(\boldsymbol{x}(t))$

lf

$$f(x_1, x_2, \dots, x_n) = f(\mathbf{x}) = f(\mathbf{x}(t))$$

with

$$x_1 = x_1(t), x_2 = x_2(t), \dots, x_n = x_n(t)$$

then

$$\frac{df}{dt} = \frac{\partial f}{\partial x} \cdot \frac{dx}{dt}$$

where

$$egin{aligned} rac{\partial f}{\partial oldsymbol{x}} = egin{bmatrix} rac{\partial f}{\partial x_1} \ rac{\partial f}{\partial x_2} \ dots \ rac{\partial f}{\partial x_n} \end{bmatrix}, rac{doldsymbol{x}}{dt} = egin{bmatrix} rac{dx_1}{dt} \ rac{dx_2}{dt} \ dots \ rac{dx_n}{dt} \end{bmatrix} \end{aligned}$$

Note that $\frac{\partial f}{\partial {m x}}$ is the Jacobian as a column-vector = $(J_f)^T$

Example with $f(\boldsymbol{x}(\boldsymbol{u}(t)))$

lf

$$f(\boldsymbol{x}(\boldsymbol{u}(t)))$$

with

$$f(oldsymbol{x}) = f(x_1,x_2), oldsymbol{x}(oldsymbol{u}) = egin{bmatrix} x_1(u_1,u_2) \ x_2(u_1,u_2) \end{bmatrix}, oldsymbol{u}(t) = egin{bmatrix} u_1(t) \ u_2(t) \end{bmatrix}$$

then

$$rac{df}{dt} = rac{\partial f}{\partial m{x}} \cdot rac{\partial m{x}}{\partial m{u}} \cdot rac{dm{u}}{dt} = egin{bmatrix} rac{\partial f}{\partial x_1} & rac{\partial f}{\partial x_2} \end{bmatrix} \cdot egin{bmatrix} rac{\partial x_1}{\partial u_1} & rac{\partial x_1}{\partial u_2} \ rac{\partial x_2}{\partial u_1} & rac{\partial x_2}{\partial u_2} \end{bmatrix} \cdot egin{bmatrix} rac{du_1}{dt} \ rac{du_2}{dt} \end{bmatrix}$$

Neural networks

Model of neurons

Definitions

$$a^{(0)} \bigcirc \bigcirc \bigcirc a^{(1)}$$
 $a^{(1)} = \sigma(wa^{(0)} + b)$

where

- a = activity
- w = weight
- b = bias
- σ = activation function

2-1 neuronal network

$$a_0^{(0)} \bigcirc w_0 \qquad a^{(1)}$$

$$a_1^{(0)} \bigcirc w_1 \qquad a^{(1)}$$

$$a^{(1)} = \sigma(w_0 a_0^{(0)} + w_1 a_1^{(0)} + b)$$

3-2 neuronal network

$$a_{0}^{(0)} \bigcirc a_{0}^{(1)}$$

$$a_{1}^{(0)} \bigcirc a_{0}^{(1)}$$

$$a_{2}^{(0)} \bigcirc a_{1}^{(1)}$$

$$a_{0}^{(1)} = \sigma(\mathbf{w}_{0} \cdot \mathbf{a}^{(0)} + b_{0})$$

$$a_{1}^{(1)} = \sigma(\mathbf{w}_{1} \cdot \mathbf{a}^{(0)} + b_{1})$$

Using a matrix notation:

$$a_0^{(0)} \qquad a_0^{(1)}$$

$$a_1^{(0)} \qquad a_1^{(1)}$$

$$a_2^{(0)} \qquad a_1^{(1)}$$

$$a^{(1)} = \sigma(W^{(1)} \cdot a^{(0)} + b^{(1)})$$

General case: n-m neuronal network

$$\begin{bmatrix} a_{0}^{(0)} & \bigcirc & a_{0}^{(1)} \\ a_{1}^{(0)} & \bigcirc & a_{1}^{(1)} \\ a_{2}^{(0)} & \bigcirc & a_{1}^{(1)} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m-1}^{(1)} \end{bmatrix} = \sigma \begin{pmatrix} \begin{bmatrix} w_{0,0}^{(1)} & w_{0,1}^{(1)} & \cdots & w_{0,n-1}^{(1)} \\ w_{1,0}^{(1)} & w_{1,1}^{(1)} & \cdots & w_{1,n-1}^{(1)} \\ \vdots & \vdots & \ddots & \vdots \\ w_{m-1,0}^{(1)} & w_{m-1,1}^{(1)} & \cdots & w_{m-1,n-1}^{(1)} \end{bmatrix} \begin{bmatrix} a_{0}^{(0)} \\ a_{1}^{(0)} \\ \vdots \\ a_{n-1}^{(0)} \end{bmatrix} + \begin{bmatrix} b_{0}^{(1)} \\ b_{1}^{(1)} \\ \vdots \\ b_{m-1}^{(1)} \end{bmatrix} \end{pmatrix}$$

Hidden layer in a neuronal network

$$a^{(0)}$$
 $a^{(1)}$ $a^{(2)}$

$$a^{(1)} = \sigma(W^{(1)} \cdot a^{(0)} + b^{(1)})$$

$$a^{(2)} = \sigma(W^{(2)} \cdot a^{(1)} + b^{(2)})$$

Function linking two layers in a neuronal network
